WEB TECHNOLOGY LAB

EXP.NO: 5

DATE: 05/03/2025

AIM:

To demonstrate the difference between the HTTP GET and POST methods by creating a form in an HTML page and handling the form submissions using two different HTTP methods in a Java Servlet.

ALGORITHM:

1. Input: The user fills out a web form with their name and email.

2. Create an HTML Form with name and email fields.

3. Provide two submit buttons for GET and POST methods.

4. Create a Servlet class to handle both doGet() and doPost() methods.

5. Retrieve form data using request.getParameter().

6. In doGet(), display data visible in URL.

7. In doPost(), display data in response body (not visible in URL).

8. Deploy in Apache Tomcat and test both methods.

9. Observe and compare GET and POST results.

PROGRAM:

1. HTML Form (index.html)

```
<!DOCTYPE html>
<html>
<head>
  <title>GET vs POST Demo</title>
</head>
<body>
  <h2>Enter Your Details</h2>

  <form action="MethodServlet" method="get">
    Name: <input type="text" name="name"><br><br>
    Email: <input type="email" name="email"><br><br>
```

```
    <input type="submit" value="Submit using GET">
  </form>

  <br>

  <form action="MethodServlet" method="post">
    Name: <input type="text" name="name"><br><br>
    Email: <input type="email" name="email"><br><br>
    <input type="submit" value="Submit using POST">
  </form>
</body>
</html>
```

2. Servlet Program (MethodServlet.java)

```
import java.io.*;
import javax.servlet.*;
import javax.servlet.annotation.WebServlet;
import javax.servlet.http.*;

@WebServlet("/MethodServlet")
public class MethodServlet extends HttpServlet {

  protected void doGet(HttpServletRequest request, HttpServletResponse response)
      throws ServletException, IOException {

    response.setContentType("text/html");
    PrintWriter out = response.getWriter();

    String name = request.getParameter("name");
    String email = request.getParameter("email");

    out.println("<h2>GET Method Used</h2>");
    out.println("Name: " + name + "<br>");
    out.println("Email: " + email);
  }

  protected void doPost(HttpServletRequest request, HttpServletResponse response)
      throws ServletException, IOException {

    response.setContentType("text/html");
    PrintWriter out = response.getWriter();
```

```
        String name = request.getParameter("name");
        String email = request.getParameter("email");

        out.println("<h2>POST Method Used</h2>");
        out.println("Name: " + name + "<br>");
        out.println("Email: " + email);
    }
}
```

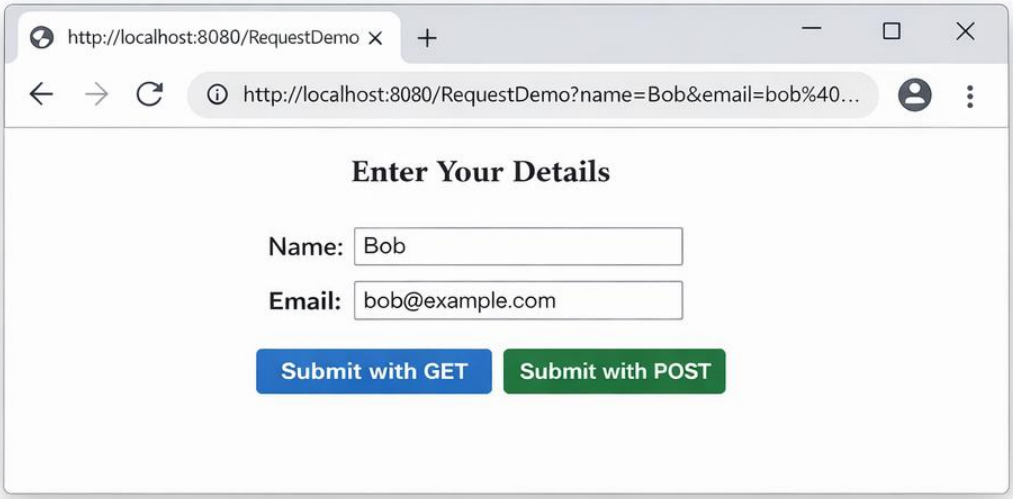
OUTPUT:

For GET method: Data is visible in the URL.
For POST method: Data is sent in request body and not visible in URL.

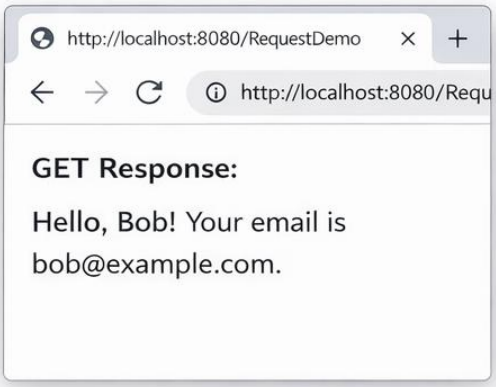
RESULT:

A Servlet is created to demonstrate the difference between HTTP GET and POST methods by creating a form and handling requests accordingly.

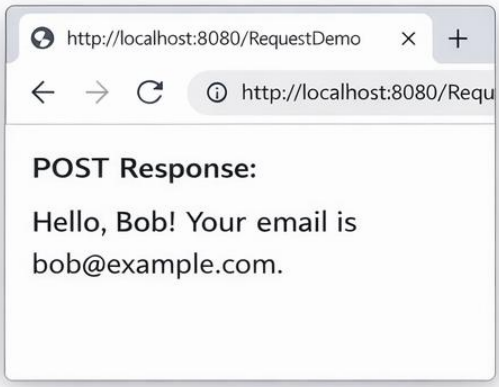
Input Form



GET Request vs POST Request



URL has form data: /RequestDemo?name:Bob&email-bob%40example.com



Form data hidden in body of the HTTP request
